Q5)

A) I will try to compute the posterior using the multiplication of the prior of the mean with the likelihood and then complete the square in the exponent. $p(\theta \,|\, x) = p(\theta) \cdot p(x \,|\, \theta)$; putting in the necessary data from the problem statement we have something like the following :

$$N(\mu,\sigma^2) \cdot N(\mu_0,\sigma_0{}^2) = c \cdot exp(-(x_1-\mu)^2/2\sigma^2 - (\mu-\mu_0)^2/2\sigma_0^2)$$

by we can be a little inventive too, we can consider the sufficient statistics of the data tenatis T(x) = x = nanfle near of dx, ... xn?

Can convert the whole problem into the univariate can again.
